Metabolic processes are constantly taking place in the body. Metabolism is the sum of all of the chemical reactions that are involved in catabolism and anabolism. The reactions governing the breakdown of food to obtain energy are called catabolic reactions.

A chemical element is a species of atom having the same number of protons in their atomic nuclei (that is, the same atomic number, or Z). For example, the atomic number of oxygen is 8, so the element oxygen consists of all atoms which have exactly 8 protons.. 118 elements have been identified, of which the first 94 occur naturally on Earth with the remaining 24 being synthetic elements.

UNEQUAL PROTEIN SOURCES. The goal in any diet is to consume an adequate amount of each essential amino acid to satisfy the recommended daily requirement. 3 However, just because various foods contain protein does not mean that those proteins are equal in nutritional value. Different proteins contain differing amounts of essential amino acids, and some, when eaten in a regular serving, do not ...

Minerals Lesson #11 . A mineral is a solid material, made of one substance, that occurs naturally on Earth. Most of the common minerals are made of crystals. A Crystal is a solid formed by a repeating, three-dimensional pattern of atoms, ions, or molecules and having fixed distances between the different parts. Minerals that do not grow in these regular or crystalline patterns are called ...
