

Failure Rate And Event Data For Use Within Risk Assessments

Failure Rate And Event Data

Failure rate is the frequency with which an engineered system or component fails, expressed in failures per unit of time. It is often denoted by the Greek letter λ (lambda) and is highly used in reliability engineering.. The failure rate of a system usually depends on time, with the rate varying over the life cycle of the system.

Failure mode and effects analysis (FMEA)—also "failure modes", plural, in many publications—was one of the first highly structured, systematic techniques for failure analysis.It was developed by reliability engineers in the late 1950s to study problems that might arise from malfunctions of military systems. An FMEA is often the first step of a system reliability study.

Cables can be an essential component, even a lifeline, to electronic systems. If a cable goes down, the entire system can fail. With four critical factors impacting their performance — mechanical, electrical, environmental and application-specific — manufacturers have to make sure cables can survive severe conditions and perform reliably over the system's lifespan.
